Lightroom 5 also keeps the checkbox for cropping images as it did in previous versions. This, quite frankly, comes as a surprise to me. I constantly crop my images in-camera. I do my image processing in-camera, then my RAW converter software. In Lightroom 5 I am no longer required to check a box, but I would have preferred a more creative solution for cropping images in-camera. For example, I would be happy to have a “Crop before Lightroom” option to crop images in-camera and have Lightroom crop the images the same way. Of course, I do not expect Adobe to do it. It would be a great first step in Lightroom 5, though. The Tips panel also does not lack any surprises. Among the things that make it stand out are the room for commentaries, the ability to add learning shortcuts for the Settings panel and the ability to access information in the Camera and Lens panel from the Comments panel. There is much more to come in the future. A new Export Options panel allows you to create a variety of output formats. You can save as a JPEG or TIFF and specify compression, tones, and image size. You can also export as a PDF, a Photoshop PDF (Like PDF format), and SVG. The latter is used to create icons and logos and even to create a web page. The component files for web pages can be made using the same tool: SVG Web. Although it has a large footprint by today’s standards, Lightroom 5 offers several new editing tools that take advantage of Adobe Sensei AI. A New Name tool lets you automatically enter a name based on your image data. Alteration tools let the operator resize and rotate image details. As you form the selection tool and you drag, the program notes every object and shows where you’ve dragged. But the precision of that is a bit disconcerting. That said, I have no complaints about these editing tools since the results do seem to improve. I like that you can now create a slideshow in Lightroom. You can also enable self-timed transitions, which I find to be a nice way to start and end a slideshow.

Photoshop was originally developed by Adobe Systems, Inc. in 1987. The software has become the standard for photo retouching and editing, but it now also features a graphics engine that allows for non-photographic editing, in addition to color correction, image compositing, and image retouching. Photoshop is designed to perform all complex tasks in a single streamlined and user-friendly application, from simple photo-manipulation tasks to the creation of artwork and complex hybrid projects. Photoshop is widely considered to be the industry standard for advanced image-editing, image compositing, and image retouching. LONDON--(BUSINESS WIRE)-- Today at Adobe MAX - the world's largest creativity conference - Adobe announced new innovations in Photoshop that make the world's most advanced image editing application even smarter, more collaborative and easier to use across surfaces. Share for Review (beta) enables users to conveniently collaborate on projects without leaving Photoshop, and new features make editing images in a browser far more powerful. Additionally, the flagship Photoshop desktop app adds breakthrough features powered by Adobe Sensei AI, including selection improvements that enhance the accuracy and quality of selections, and a one-click Delete and Fill tool to remove and replace objects in images with a single action. Using Share for Review and Adobe Experience Cloud, users can now collaborate on projects just as they do in creative spreadsheets and Keynote. With Share for Review, Photoshop users can turn in-progress work and see online changes within the app. Additionally, Share for Review lets people annotate images - a first for Photoshop - that's right: They don't just edit the original photos; they can edit what they see in the image. In a current project, for example, a user can select a photo and markup a region of the photo, or give a layer a new name, or add a phrase. That editing gets applied to the open file right there in Photoshop, not simply sent to someone back on the network.
